KOSH

Your data. Your building. Your answers.

Private AI that answers plain-language questions from a company's own database — exactly, instantly, and without ever training on the data.

Seed round · ₹50 lakh · Om Gawande

THE PROBLEM

The answers already exist. Nobody can reach them.

A student asks when their exam is. A manager asks how many staff are in a department. The answer is sitting in a database, three feet away, and completely out of reach.

1. **Know SQL**
   Almost nobody in the organisation does.

2. **Find someone who does**
   Their week disappears into repeat lookups.

3. **Wait for a report**
   Every new question needs a developer.

₹0

of new value from data
the organisation already paid to collect

The data isn't missing.
The access is.

WHY IT IS STILL UNSOLVED

Every existing option gives one of these up

Private · Current · Correct

BI dashboards

Answers only what someone anticipated. Every new question needs a developer.

Gives up coverage

Cloud AI

Sends student, patient or financial records to a third party.

Gives up privacy

Fine-tuned local model

Plausible answers, not exact. Cannot forget a deleted record.

Gives up correctness

LLM writing SQL

39% accurate on benchmarks. 21% on real enterprise schemas.

Gives up accuracy

Sources: BIRD text-to-SQL benchmark, on-premise open-model study; Spider 2.0 production accuracy analysis.

WHY NOW

India's DPDP Act makes this urgent — and breaks the alternatives

Nov 2026

Phase 1 obligations begin

May 2027

Full compliance required

₹250 cr

Maximum penalty per breach

No "legitimate interest"

The clause that decides this market

Every person may demand erasure of their data — and that creates an obligation to retrain any model their data went into.

A fine-tuned model cannot honour a deletion request without being rebuilt. Ours never has to — because it is never trained on the customer's data in the first place. Compliance is not a feature we added; it is the architecture.

Source: DPDP Rules notified 14 Nov 2025; phased obligations Nov 2026 and May 2027.

WHAT WE BUILT

Install it, point it at the database, ask questions

1

Install

On the organisation's own server. Nothing leaves the building.

2

Adapt

It reads the schema and learns the organisation's own vocabulary in minutes.

3

Answer

Plain-language questions, exact answers, with the records shown.

4

Stay current

A sync worker watches the database. Changes appear in seconds.

The one decision everything rests on

The model is never trained on the customer's data. Adaptation happens in indexes and query templates — never in the model's weights.

HOW IT WORKS

Most questions never touch the AI model at all

That is why it is fast, and why it is exact.

Repeat questions Served from memory	~0.1 s
Counts, averages, lookups Answered directly from the database with a prepared query — no AI involved	< 0.5 s
Written descriptions Generated overnight, stored, served instantly	~0.1 s
Genuinely open questions The AI model writes the answer, checked against the records before display	seconds

An exact database lookup cannot invent a number. That is the whole point.

THE DIFFERENCE

Why a competitor cannot simply copy this

	Cloud AI	Fine-tuned local	KOSH
Data stays on site	No	Yes	Yes
Answers are exact	No	No	Yes
Reflects today's data	No	No	Yes
Deletion is real	No	No	Yes
Shows its source	No	No	Yes
Runs without a GPU	n/a	No	Yes

Competitors who fine-tune inherit an erasure problem they cannot engineer away. That is a legal position, not a feature gap.

TRACTION

It is built, deployed and measured — not a concept

72.8%	468 ms	100	379
of real questions answered with no AI model involved	typical answer time (95th percentile)	users at once, still answering in 0.55 s	automated tests passing

Measured against 886 genuine user requests over 195 distinct questions — not a synthetic benchmark.

- ✓ Running today over a live institutional database with real records
- ✓ Full production security audit completed: read-only access, injection defences, audit trail on every answer
- ✓ Migration to Microsoft SQL Server complete — the database most Indian institutions already run
- ✓ Answers cite the records they came from, and refuse rather than guess when they cannot verify

PROOF IN TEN SECONDS

The demo that ends the conversation

Same question. Same laptop. Same second.

A general AI assistant

"How many staff are in Finance?"

"Approximately 45."

Invented. Ask again and the number changes.
No source. No way to know it is wrong.

KOSH

"How many staff are in Finance?"

1,916

Counted from the records, in 0.4 seconds,
with the rows it used shown underneath.

"Both are AI. Only one can be trusted with a board report."

MARKET

Start where the pain is sharpest and the door is open

53,636

colleges in India
(AISHE, July 2026)

Beachhead

Engineering colleges in Maharashtra with existing IT systems

~50 in 24 months

Expand

Private universities and colleges across India (69% are privately run)

~1,000 realistic

Adjacent

Hospitals, cooperative banks, manufacturers — same DPDP obligation

Same product

Bottom-up, not top-down

We are not claiming a share of a trillion-rupee AI market. 1,000 institutions at ₹3 lakh per year is ₹30 crore of recurring revenue — reachable with a small team, and only 2% of Indian colleges.

Every one of them has a database, a compliance deadline, and no GPU budget.

BUSINESS MODEL

Annual licence, installed on their hardware

₹3 lakh

per institution per year

Licence + support + updates

~85%

gross margin

No cloud inference cost.
No per-query cost.

< ₹1 lakh

cost to serve per customer

Deployment, support, and upgrades

Why they renew

It sits on their compliance path, it holds their data, and it improves every month as it learns which questions they actually ask.

Upgrade path

A GPU tier for institutions wanting fast answers to open-ended analysis. Higher licence, same software, no re-engineering.

THE ASK

₹50 lakh to reach three paying institutions

₹24 L	Two engineers, 18 months
₹11 L	Pilot deployments & hardware
₹9 L	Founder runway
₹6 L	Legal, DPDP audit, IP

What ₹50 lakh proves

- Three institutions paying, under signed contracts
- A one-day install against a database we have never seen
- DPDP compliance position reviewed by counsel
- Deployment repeatable by someone other than the founder
- Ready to raise a priced round on revenue, not a demo

18 months of runway

Your staff cannot get answers out of your own data without waiting for someone.

Cloud AI would leak it. Local AI would make it up.

We do all three — private, current, correct — on the hardware you already own.
